

# Hub-and-Spoke Virtual Network — rg-hubspoke-lab (West US)

Single Resource Group · All resources tagged project=hubspoke-lab env=lab

## Legend

-  Network Security Group (NSG) attached at subnet level
-  Bidirectional VNet Peering (configured both directions)
-  Path explicitly blocked (no peering, traffic dropped)
-  SSH traffic (allowed by NSG, restricted to home IP /32)

Dashed subnet borders = subnet boundary inside VNet

Greyed subnets = reserved for future use (no resources deployed)

**Traffic flow: Laptop → Jump host (Public IP, SSH :22) → SSH onward to spoke VMs via peering**

## NSG Rules Summary

**nsg-hub-mgmt (snet-hub-mgmt):**  
100 Allow SSH :22 from /32  
200 Deny SSH :22 from Internet  
--- default rules (allow VNet, deny all else)

**nsg-spoke1-app / nsg-spoke2-app:**  
100 Allow SSH :22 from 10.0.2.0/24 (hub)  
--- default rules (allow VNet, deny all else)

**Effect: Spoke VMs reachable ONLY from hub mgmt subnet.**

Lower priority number wins. Default rules at 65000–65500 cannot be deleted.
